What is Nicotinamide Riboside (NR)?

NR is a next-generation vitamin B₃ that has been found to be naturally-occurring in milk in trace amounts¹. The metabolism of NR is unique from that of other more commonly known forms of vitamin B₃, nicotinamide and nicotinic acid. Specifically, NR has been shown in a pre-clinical study to be the most effective form of vitamin B₃ at increasing nicotinamide adenine dinucleotide (NAD+)².

Nicotinic acid (also known as niacin) and nicotinamide (also known as niacinamide) were discovered in the 1930’s to be the factors that cured pellagra³. Niacin is known to cause severe flushing⁴. In 2004, nicotinamide riboside emerged as a newly discovered NAD+ precursor⁵ and does not bind to the receptor responsible for flushing⁶.

NR has pre-clinically demonstrated that it is superior to both niacin and nicotinamide, both of which are standard forms of vitamin B₃ commonly used in vitamin supplements and foods, at boosting NAD+². This is due to the fact that NR is not reliant upon a conversion step requiring the enzyme “NAMPT”⁷,⁸, see Figure below. The activity level of NAMPT determines the amount of nicotinamide that is converted into NAD+⁹, which is why this particular step in the process is often referred to as the “rate limiting step”¹⁰. As normal aging occurs, the activity of NAMPT is thought to decrease¹¹-¹⁵. NR can be used by the cell to make NAD+ without this enzymatic step.

Figure – NAD+ synthesis from nicotinic acid, nicotinamide, and nicotinamide riboside

Why is NR Important?

NR is important because it is a potent and bioavailable pre-cursor to NAD+²,⁵. NAD+ is essential to life and is known to be vital to functions that ensure proper cellular and energy metabolism¹⁶. The most well-known function of NAD+ is the transferring of electrons to the machinery in the cell that produces ATP, the energy currency of all cells¹⁷,¹⁸.

NAD+ is increasingly being shown to have important functions beyond electron transfer. One of the most promising potential roles for NR as a pre-cursor to NAD+ is activation of sirtuins, enzymes associated with a wide variety of functions related to metabolism and longevity⁸,¹⁹-²¹.

Sirtuins – The “Anti-Aging Proteins”

- The sirtuins are proteins that have been shown to perform vital longevity functions in mice and in cellular models.¹⁹-²¹.
- Increasingly, there is support for the hypothesis that decreased cellular NAD+ results in a decline in sirtuins activity.¹¹,²².
- A pre-clinical study published in 2016 in the journal *Nature Communications* supports the hypothesis that NR is more potent than nicotinamide and nicotinic acid at increasing NAD+.

**Human Studies of NR**

- The first human study of NIAGEN® nicotinamide riboside was published in 2016 in the journal *Nature Communications*. This study reported dose dependent increases in the NAD+ metabolome following oral administration of 100, 300, and 1000 mg single doses of NIAGEN® in adults. There is much interest in the potential for meaningful health benefits of nicotinamide riboside. As a result, human studies are being conducted with NIAGEN®.

Human studies of nicotinamide riboside are registered on the U.S. National Institutes of Health website: [www.clinicaltrials.gov](http://www.clinicaltrials.gov) (search “nicotinamide riboside”).

Regulatory Status of NIAGEN®

NIAGEN® has a successful New Dietary Ingredient Notification with FDA (NDIN 882) for daily recommended intake of not more than 180 mg/d.

NIAGEN® is generally recognized as safe (FDA GRAS Notice No. 635) for use in vitamin waters, protein shakes, nutrition bars, gum, chews, and powdered beverages. Maximum use level 0.0057% by weight.

NIAGEN® Patents

NIAGEN® has five issued process and use patents with more pending.

Potential NIAGEN® Applications

NIAGEN® can be used in capsules, tablets, melts or in powder form as a dietary supplement. It can also be included in functional foods and beverages in the following categories: vitamin waters, protein shakes, nutrition bars, gum, chews, and powdered beverages.
